

ShwayFit

Mobile-first client management for independent fitness trainers

PUBLIC DOMAIN https://shwayfit.app	INITIAL SCOPE One trainer, designed to grow to five independent organizations.
---	--

Purpose

ShwayFit gives a trainer one phone-friendly place to manage clients, appointments, workout plans, session packages, and client history. The name is a personal tribute to Shweta.

First complete workflow

- Trainer signs in and creates a client.
- Trainer records a session package, including an opening balance for an existing client.
- Trainer books an appointment and reviews it in a daily agenda or calendar.
- Completing the appointment deducts one session through a retry-safe transaction and records an audit entry.

POC capabilities

- Client records, appointment booking and status, workout plans, appointment history, session balances, and proposed progress notes and measurements.
- Email appointment reminders through Resend. Replies are not monitored; clients contact the trainer directly.
- No client portal, payments, photo storage, external calendar sync, group bookings, or recurring series in the POC.

Architecture

React and TypeScript run as a separate frontend on Firebase Hosting. A Go REST API runs on Cloud Run and owns all business access to Cloud Firestore. Firebase Authentication will secure trainer sign-in. Each independent trainer has an organization; roles and client assignment are verified by the API.

Current foundation

The landing page and API health check are live. The Firebase project is separate from Routefy resources while using the approved shared billing account. Cloud Run scales to zero when idle, and a ShwayFit-only CAD \$10 monthly budget alert is configured.

Next step

Configure trainer authentication, then build the first end-to-end client, package, appointment, and completion flow.
